

The Sicame JTS/3 range of Lifting Keys has been designed to free road level inspection covers and assist in their lifting under adverse conditions such as the ingress of dirt or grit, rusting, frost and ice, or impact from heavy vehicles. The initial seal is broken by using the lifting key horizontally so that, by means of a simple cantilever effect, the cover can be dislodged when pressure is applied to the lifting key handle. Once released, a position convenient for lifting the cover can be achieved by moving the key up to its vertical position, allowed for by the swivelling arm arrangement illustrated above. Alternatively, two people each with a key can lift awkwardly-placed or particularly heavy covers. The JTS/3A and 3B product has an additional feature of an integral hook for the lifting of Link Box bell covers.

Alternative types of lifting pins and hooks can be supplied to meet specific requirements.
